VILLAGE OF TARRYTOWN WATER SUPPLY

HOMEOWNER TAP SAMPLE COLLECTION – PROCEDURES

These samples are being collected to determine the contribution of faucet fixtures and household pipes and/or solder to the lead and copper levels in tap water. This sampling effort is required by the Environmental Protection Agency, and is being accomplished through the cooperation of homeowners and residents.

A sample is to be collected after an extended period of stagnant water conditions (i.e., no water use or leakage during this period) within the interior piping. Due to this requirement, either early mornings or evenings upon returning from work are the best times for collecting samples. The collection procedure is described in more detail below.

1. A minimum 6 – 8 hour period during which there is no water use must be achieved prior to sampling. The water department recommends that either early mornings or evenings upon returning home are the best sampling times to ensure that the necessary stagnant water conditions exist. Please do not flush toilets during the 6 – 8 hour period.
2. A kitchen or bathroom cold-water faucet is to be used for sampling. Place the sample bottle (open) below the faucet and gently open the cold water tap.
3. Place the sample bottle outside the residence in the location of the bottle's delivery point in order that department staff may pick up the sample kit.
4. Results from this monitoring effort will be provided to participating customers when reports are generated for the State unless excessive lead and /or copper levels are found. In those cases, immediate notification will be provided (usually ten working days from the time of sample collection.)

CALL STEVE at 631-0456/0356 if you have any questions regarding these instructions and sample pick up.

TO BE COMPLETED BY RESIDENT:

Water was last used: Time 1:30 PM Date 5/11/15

Sample was collected: Time 4:00 PM Date 5/11/15

I have read the above directions and have taken a tap sample in accordance with these directions.

These samples are being collected to determine the contribution of faucet fixtures and household pipes and/or solder to the lead and copper levels in tap water. This sampling effort is required by the Environmental Protection Agency, and is being accomplished through the cooperation of homeowners and residents.

A sample is to be collected after an extended period of stagnant water conditions (i.e., no water use or leakage during this period) within the interior piping. Due to this requirement, either early mornings or evenings upon returning from work are the best times for collecting samples. The collection procedure is described in more detail below.

1. A minimum 6 - 8 hour period during which there is no water use must be achieved prior to sampling. The water department recommends that either early mornings or evenings upon returning home are the best sampling times to ensure that the necessary stagnant water conditions exist. Please do not flush toilets during the 6 - 8 hour period.
2. A kitchen or bathroom cold-water faucet is to be used for sampling. Place the sample bottle (open) below the faucet and gently open the cold water tap.
3. Place the sample bottle outside the residence in the location of the bottle's delivery point in order that department staff may pick up the sample kit.
4. Results from this monitoring effort will be provided to participating customers when reports are generated for the State unless excessive lead and /or copper levels are found. In those cases, immediate notification will be provided (usually ten working days from the time of sample collection.)

CALL STEVE at 631-0456/0356 if you have any questions regarding these instructions and sample pick up.

TO BE COMPLETED BY RESIDENT:

Water was last used: Time _____ Date _____

Sample was collected: Time _____ Date _____

I have read the above directions and have taken a tap sample in accordance with these directions.

Signature: _____ Date: _____
